Cheri DeJong

AGRIVISION FARM MANAGEMENT

What We Do

Natural Prairie Dairy produces **best-in-class, highest quality certified organic milk from family-run, sustainable farms** in Texas and Indiana.

Meet the De Jong's

Donald and Cheri started with 800 cows in the High Plains of Texas and dedicated 15 years to building the organization from the ground up. Now, NPD has over 15,000 certified organic cows and 250 team members, all dedicated to producing an exceptional product.

Milk Quality Standards & Certifications

Our organic farms undergo an intense certification process.

21st Century Farming

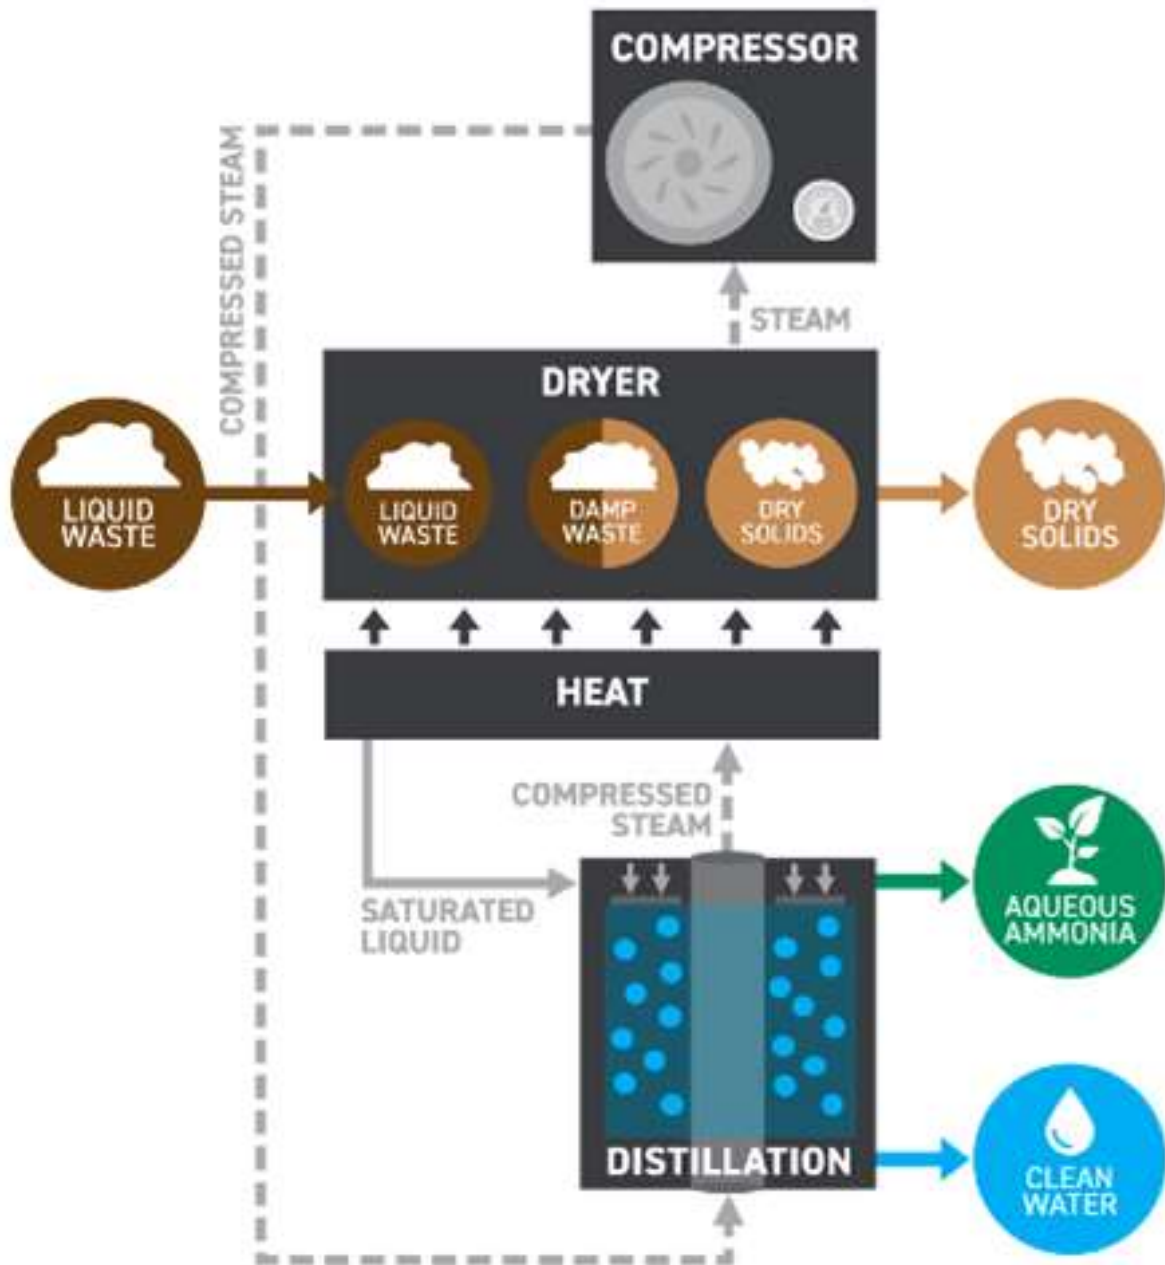

We utilize the most **advanced technology** to help keep our process **efficient** and produce the best quality organic milk.

21st Century Farming

Our **newest innovation**, a manure management process called the **Varcor**, will **transform animal agriculture for the better, forever.**

The Varcor solution:

- Helps a dairy operate as a **closed loop system** and **reduces the overall carbon footprint, helping to achieve net zero**;
- **May reduce the need for anaerobic ponds**;
- **Additional source of clean water to be applied to fields and/or fed to cows**;
- **Source of concentrated aqueous ammonia** that can be applied when and where needed;
- Opens doors to new **cost-saving and revenue producing opportunities, including** certified organic NPK that can be applied or sold to others.

CLIMATE AI

Black Boxes and Black Dirt: Practical applications of AI in agriculture with ClimateAi

Leverage AI to win at business

- What it **is** – and what it **isn't**
- What **differentiates** ClimateAi
- **Specific use cases** where it matters

What AI is

Mat Velloso

@matvelloso

Difference between machine learning and AI:

If it is written in Python, it's probably machine learning

If it is written in PowerPoint, it's probably AI

5:25 PM · Nov 22, 2018 · Twitter Web Client

What AI is

Artificial intelligence refers to systems that generate predictions from past correlations...

...and continue to update and improve upon those predictions as more data becomes available

Common benefits

- ✓ More complexity, nuance, and power than a simple regression
- ✓ Quickly and cheaply automate repetitive tasks
- ✓ More lightweight than a super-computer

What AI **isn't**

Easy to build

Resources needed to train a state-of-the-art AI model *has grown over 300,000x since 2012*, while the transistor count of NVIDIA GPUs has grown only ~4x

Automated

(At least to start)

Most AI models rely on a “human in the loop” to clean data and validate outputs

“All knowing”

Edge cases are a consistent problem – an AI can't predict things it has never seen

Source: Andreessen Horowitz

The “average” is no longer average

Historical averages no match for increasing climate variability

Historical average-based planning shows increasing error...

..making an already difficult task (yield forecasting) harder than before

- Increased risk of **over production**:
Negative price pressures or waste
- Increased risk of **under production**:
Unable to fulfill contracts, or forced into unprofitable positions to keep customers happy

Leverage AI to win at business

- What it **is** – and what it **isn't**
- What **differentiates** ClimateAi
- **Specific use cases** where it matters

ClimateAi provides **best-in-class predictive weather analytics** to forecast the impact of climate change on crops

In a shifting climate....

Past performance is not indicative of future success

ClimateAi solution

Best-in-class climate forecasting provide daily, weekly, monthly, and decadal insights. From a regional down to a field level.

Access to proprietary data sets enables ClimateAi to have a deeper understanding of climate impacts on crops than anyone else

Analytics layer links forecasts to specific, actionable insights – what risks am I exposed to? How can I better manage those risks?

Made possible by **patented physics-driven AI** breakthroughs in forecasting extreme weather impacts

AI breakthroughs
from **Autonomous
Vehicle** industry

Science
breakthroughs from
**extreme weather
forecasting for
rocket launches**

Up to 105% **improvement** forecasting
extreme precipitation 2-3 weeks out

\$250K **grant** awarded to
extend model to sub-
seasonal timeframe

1. 6 patents filed on this tech- three granted already. Read about our tech in the [patent here](#).
2. Please see the appendix for our accuracy benchmark with the best available alternatives

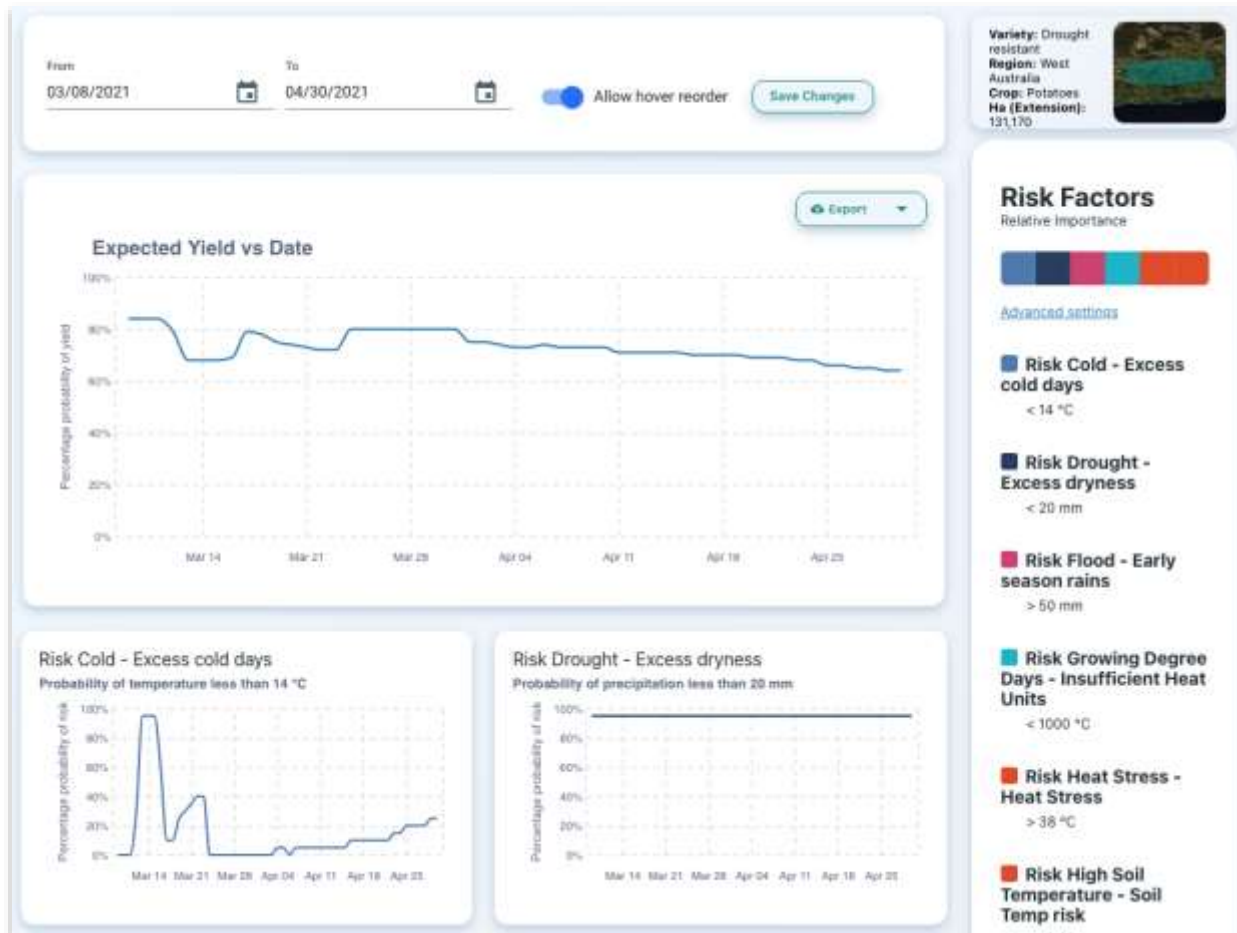

Leverage AI to win at business

- What it **is** – and what it **isn't**
- What **differentiates** ClimateAi
- **Specific use cases** where it matters

Optimize Timing: Weather-optimized decision tools

Partnered with Australian Seed Co. to identify optimal planting windows that maximized potential yields

How you can leverage these insights

- ✓ **Link forecast to key decisions** that matter at different times: Planting, Spraying, Harvesting, etc.
- ✓ **From reactive to proactive:** Advanced notice and forecast probabilities for any/all conditions of concern
- ✓ **No data required** to deliver insights

Forecast Yield: AI insights take the guesswork out of understanding drivers of yield & isolates what you can control

Key Features by Date

Result for this customer: **30%+ improvement in Yield forecast**

We can deliver a year end report enabling you to **benchmark crop managers**, adjusted for environmental factors

Climate Credit Score

Not just “warmer,” but when, by how much, and *what impact will it have*

Case Study: Deep climate risk scrutiny to assess exposure

Identified specific risks and trends from climate change to assess specific production risk for global agri-chemical player

Value for Agribusiness

- ✓ **Deep-dive on growing season risks**, specific to region and crop
- ✓ Directly climate impacts on crop to **yield impacts** and potential credit worthiness
- ✓ Scale across portfolio and **integrate into siting criteria**

AI tools are powerful, available, and effective

The next step is to understand the use cases for *your* business, and develop the capabilities and partners to deploy

Does the mucilage play a role in supporting N₂ fixation activity?

N₂ fixation requires carbon source (energy) and low O₂.
Can mucilage provide this environment?

Unique microbial consortia enriched for nitrogen fixation found in mucilage

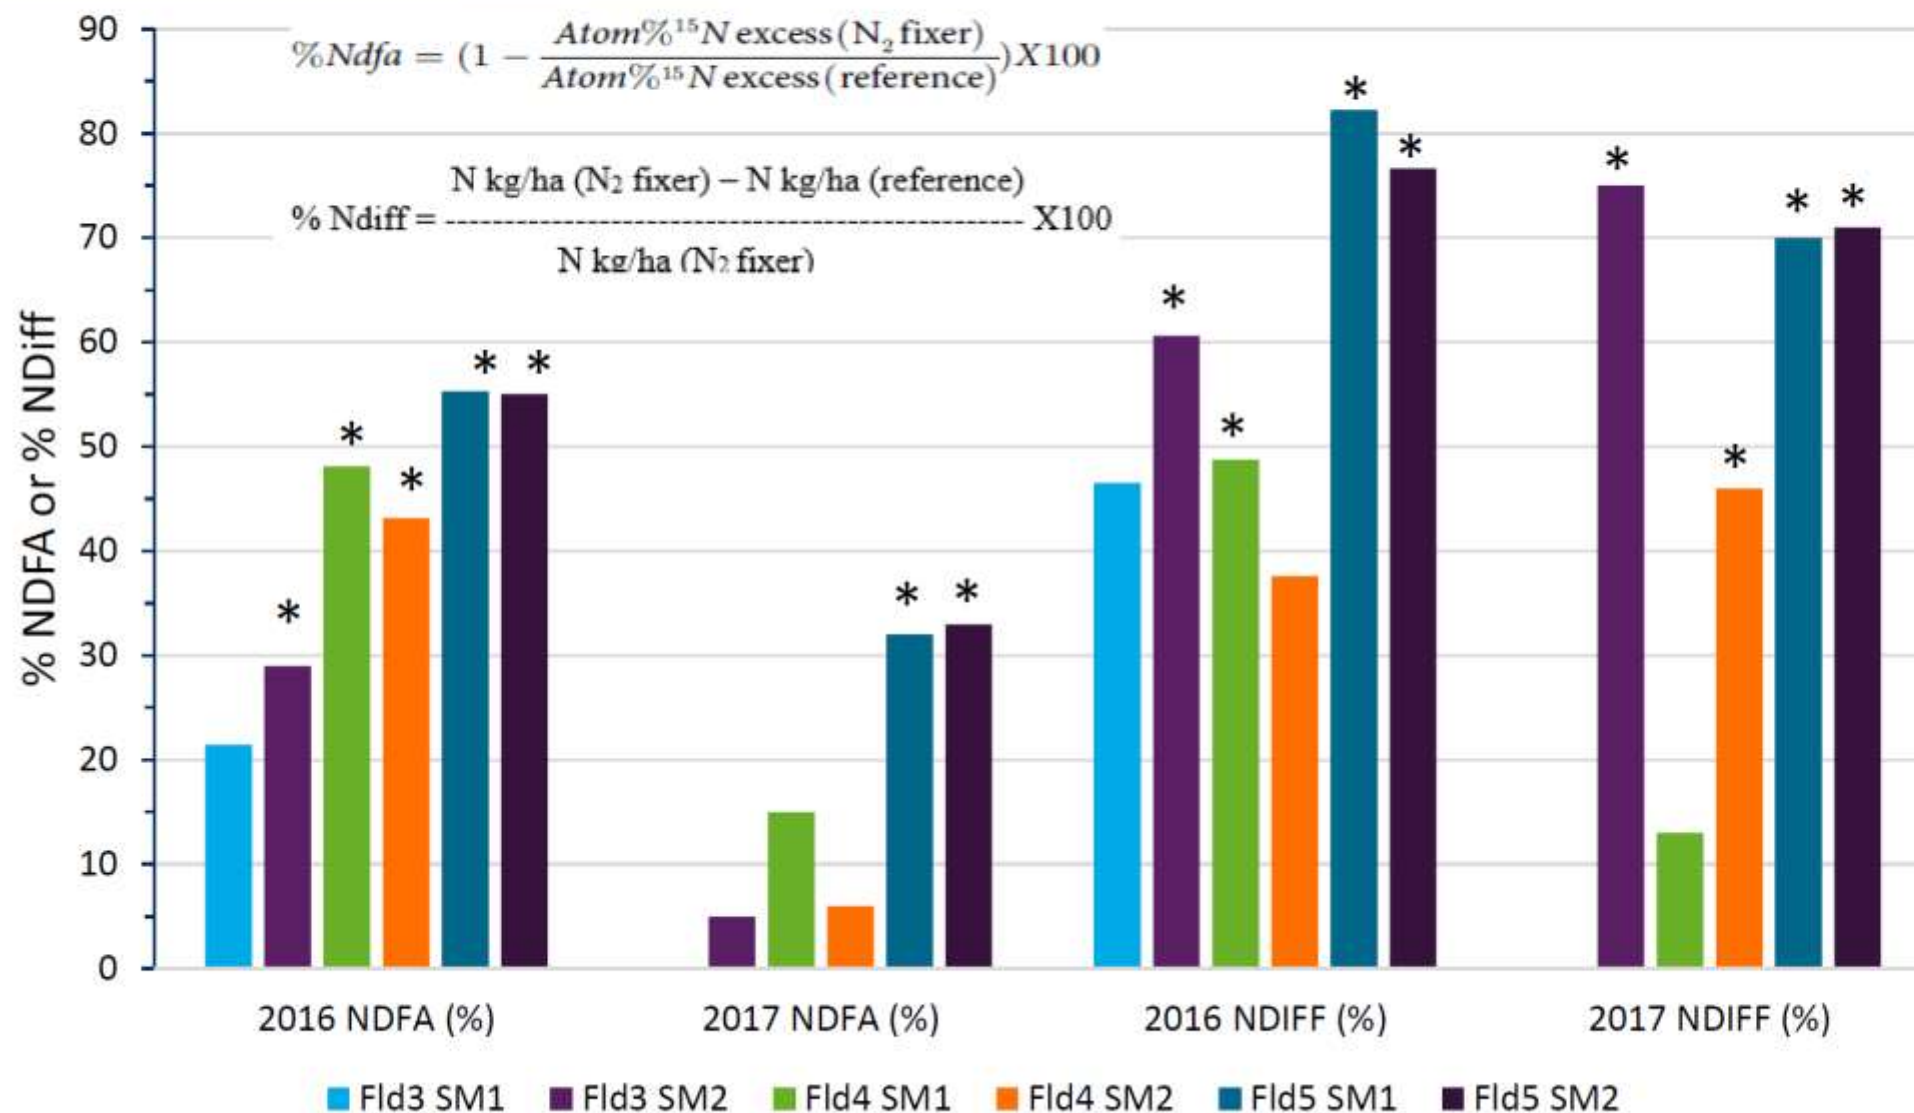

Low N

+ BCW 201900
